- 1. (a) Yes. M accepts 0100.
 - (b) No. M rejects 011.
 - (c) No. No input string is given.
 - (d) No. R is not a DFA.
 - (e) No. L(M) is not empty.
 - (f) Yes. By definition, L(M) = L(M).
- 2. We define the language EQ_{DR} as

$$EQ_{DR} = \{\langle A,R\rangle \mid A \text{ is a DFA}, R \text{ is a regular expression, and } L(A) = L(R)\}$$

To show EQ_{DR} is decidable, we construct Turing machine M which decides EQ_{DR} .

$$M =$$
 "On input $\langle A, R \rangle$

- 1. Construct DFA B which recognises R (see theorem 1.39).
- 2. Run $EQ_{DFA}\langle A,B\rangle$ (see theorem 4.5). If $EQ_{DFA}\langle A,B\rangle$ accepts, accept, else reject."
